

Boreal turns serious requests into finished work.

A request-native work commerce layer for work AI
cannot responsibly finish alone.

———— One durable thread for buyer demand, human + AI fulfillment, proof, and settlement.

AI made output cheap. It did not make work complete.

The gap shows up after the answer: ownership, local access, verification, payment, and handoff still break.

AI OUTPUT

"Here is the plan, checklist, and draft."

BUYER NEED

"Who actually finishes it and proves it worked?"

No accountable owner

Tasks scatter across chat, docs, tools, and contractors.

No real-world bridge

Onsite checks, local access, and witnessed handoffs vanish from the plan.

No proof or payout thread

Delivery, review, receipts, and compensation live elsewhere.

Our first demand map is not generic AI work.

It is urgent startup and SMB work where fuzzy intake, mixed execution, and proof show up together.

10/5

10 judged problem classes across 5 repeated pain clusters, distilled from 40 fresh evidence notes.

Source: Boreal problem-intel snapshot, generated 2026-05-23.

PROOF REQUIRED -> URGENT BUYER DEMAND

A Request is the durable work thread.

The same object carries demand, route, commitment, funding, fulfillment, artifact, and transaction truth.

Physical presence is not an edge case.

Plans must preserve onsite checks, local access, pickup, witnessed handoff, and photo proof instead of calling text output complete.

Human work can be inserted.

The request can route to a field inspector, operator, reviewer, or local technician when the job requires it.

Generated reports are not proof.

Proof means accepted artifacts, evidence claims, signatures, photos, test results, or owner review.

AI plans should not underwork.

Boreal treats missing access, geography, timing, and safety details as planning truth, not prompt noise.

Global work needs wallet-native settlement.

Boreal remains the request system of record. Solana is the target rail for programmable funding, credits, and payout flows around that work.

- **Stablecoin-native demand.**
Fund one request, one public problem, or one reusable run without forcing bank rails first.
- **Composable payout graph.**
Solvers, reviewers, contributors, and local operators can be compensated from request-attached terms.
- **Useful on-chain boundary.**
Value moves on Solana; scope, proof, artifacts, and review remain readable in Boreal.

Start with paid request pilots, not broad browsing.

The first market is high-value digital work where buyers already

know AI alone is not enough.

PILOT LANE

BUYER PAIN

PROOF NEEDED

Automation rescue

Zapier, CRM, and workflow chains silently drift or misfire.

working build + handoff

Security questionnaires

Draft answers are easy; evidence-backed submissions block deals.

evidence pack + review

Vibe-code rescue

Founders ship demos, then hit bugs, tests, deploys, and ownership gaps.

fix log + test proof

CRM handoff verification

Status says done while replies, owners, or next steps never happen.

reply-vs-status audit

Finance cleanup

Receipts, exceptions, close checklists, and sign-off live everywhere.

reconciliation + approval

Solved work should compound.

Accepted artifacts can become public solutions that are free to inspect and paid to run when Boreal spends live execution capacity.

This is more than a memo.

The repo already carries the request model, active workspaces, desktop runtime direction, and evidence engine. We are not claiming a fully public marketplace yet.

Web app: request rooms, services, buyer credit slice

Desktop: local runtime, human intervention, verification path

Peer/runtime packages: network identity and transport foundation

Canon, schemas, evals, and problem-intel artifacts

Request-native object model

Request, Commitment, Fulfillment, Artifact, Transaction, and RequestEvent stay explicit.

Problem-intel lane

Evidence snapshots turn repeated public pain into draft-safe request opportunities.

Desktop runtime path

Built for work that needs local tools, human checks, and completion beyond chat.

Commerce direction

Buyer-funded pilots first, curated supply second, public solution reuse later.

Commerce first. Software-mediated fulfillment second.

Revenue follows the request thread instead of forcing seat pricing before transaction value is proven.

Funded request GMV

Primary take rate on buyer-funded requests and eligible request grants.

FIRST ENGINE

Premium routing

Curated supply, urgency, review, and higher-trust completion lanes.

MARGIN LAYER

Paid solution runs

Credits consumed when a user reruns or forks a public solution with live capacity.

REUSE LOOP

POSITION

The gap is between matching and completion.

Each adjacent category validates demand, but stops before a durable request owns commitment, fulfillment, proof, and payout.

- **Bounty boards**

public problems, but funding,
review, proof, and reuse fragment
across systems

- **Work marketplaces**

large supply, but listing-rooted
and weak at AI-native fulfillment
continuity

- **AI tools**

fast drafts and agents, but no
buyer-funded work thread or
payout truth

- **Boreal**

request-rooted external work
commerce across human + AI
supply

Prove Solana-native work.

Paid request pilots first. Settlement path next. No token story required.

Herald Bayoca

Product engineer with 5+ years across applied AI, automation, commerce systems, and blockchain products.

Founder/CTO at OnChainSupply; secured SAFE investment and delivered crypto event activations with Trilitech across ETHCC, TezDev, Token2049, and ETHDenver.

IBM consulting and implementation work across AI, tokenization, secure workflows, and enterprise pilots.

6x global hackathon winner; co-founder/trainer at The Blokc Labs for 200+ builders.

1

Design partners

Startup and SMB buyers with urgent work requests that need human + AI fulfillment and proof.

2

Curated solvers and reviewers

Operators, builders, field-capable contributors, and specialists who can close proof-bearing work.

3

Solana settlement guidance

Stablecoin funding, request grants, contributor payout, and credit-run design that fits ecosystem norms.

4

Pilot distribution

Help us turn public problem evidence into funded requests that produce accepted, reusable artifacts.
